6. **Rezultātu saraksts.** Meklēšanas rezultāti tiek attēloti divās sadaļās: “Articles” (komentāri, gadījumu izpēte, pētījumi u.c.) un “Figures/Multimedia” (diagrammas, audio, video datnes u.c.). Iegūto rezultātu sarakstu varat sašaurināt (“Filter”) pēc nozares, informācijas avota veida un izdošanas perioda. Sarakstu varat saglabāt (“Save”) turpmākai izmantošanai, šajā gadījumā nepieciešams reģistrēties vietnē. Rezultātu sarakstu varat kārtot pēc atbilstības, izdošanas datuma vai citējumu skaita. **Search Results.** Results are divided in two sections: “Articles” and “Figures/Multimedia”. You can filter results by Speciality, Article Category and Date. You can Save the result list if you register in the site. You can sort the result list by Relevance, Date and Most Cited articles.

### Abstract

Vaccines are among the most effective prevention tools available to clinicians. However, the success of an immunization program depends on high rates of acceptance and coverage. There is evidence of an increase in vaccine refusal in the United States and of geographic clustering of refusals that results in outbreaks. Children with exemptions from school immunization requirements (a measure of vaccine refusal) are at increased risk for measles and pertussis and can infect others who are too young to be vaccinated, cannot be vaccinated for medical reasons, or were vaccinated but did not have a sufficient immunologic response. Clinicians can play a crucial role in parental decision making. Health care providers are cited as the most frequent source of immunization information by parents, including parents of unvaccinated children. Although some clinicians have discontinued or have considered discontinuing their provider relationship with patients who refuse vaccines, the American Academy of Pediatrics Committee on Bioethics advises against this and recommends that clinicians address vaccine refusal by respectfully listening to parental concerns and discussing the risks of nonvaccination.

VACCINES ARE AMONG THE MOST EFFECTIVE TOOLS AVAILABLE FOR PREVENTING infectious diseases and their complications and sequelae. High immunization coverage has resulted in drastic declines in vaccine-preventable diseases, particularly in many high- and middle-income countries. A reduction in the incidence of a vaccine-preventable disease often leads to
